Hello,

Welcome to Arizona Information Technology Institute! We are a small STEM non-profit specializing in teaching IT skills initially to the underserved kids and adults of Arizona and will later expand access to the general public after our beta program for Arizona ends. The courses will be custom made for people who want to learn more about technology but don't necessarily know where to start. All of the offered courses will be for free and the content may be used freely with no modifications made.

Our funding will come from corporate grants and donations (if applicable). If you would like to donate to AZ IT Institute, please contact us on our website.

The format of the course will be divided into modules based on different IT facets and will include reading materials, videos, quizzes, homework assignments, and guided labs. The reading materials, videos and guided labs are intended to provide an introduction to IT concepts and guide the students through a particular process. All of the course content will be created by two IT experts who have years of experience and want to teach their knowledge to other people.

Concepts will include an introduction to IT, computer hardware, computer software, and others. All of the resources for the material e.g. applications to download will be included and/or links to download them. Videos, labs, and other

resources will show how to do an IT concept and possible solutions for problems that could be encountered.

We look forward to teaching you more about IT.

All the best,
